☐  Core Memory (Castle)

Really cool overall effect, but could we possibly have this without having to scroll? (purely UX thing)

2)

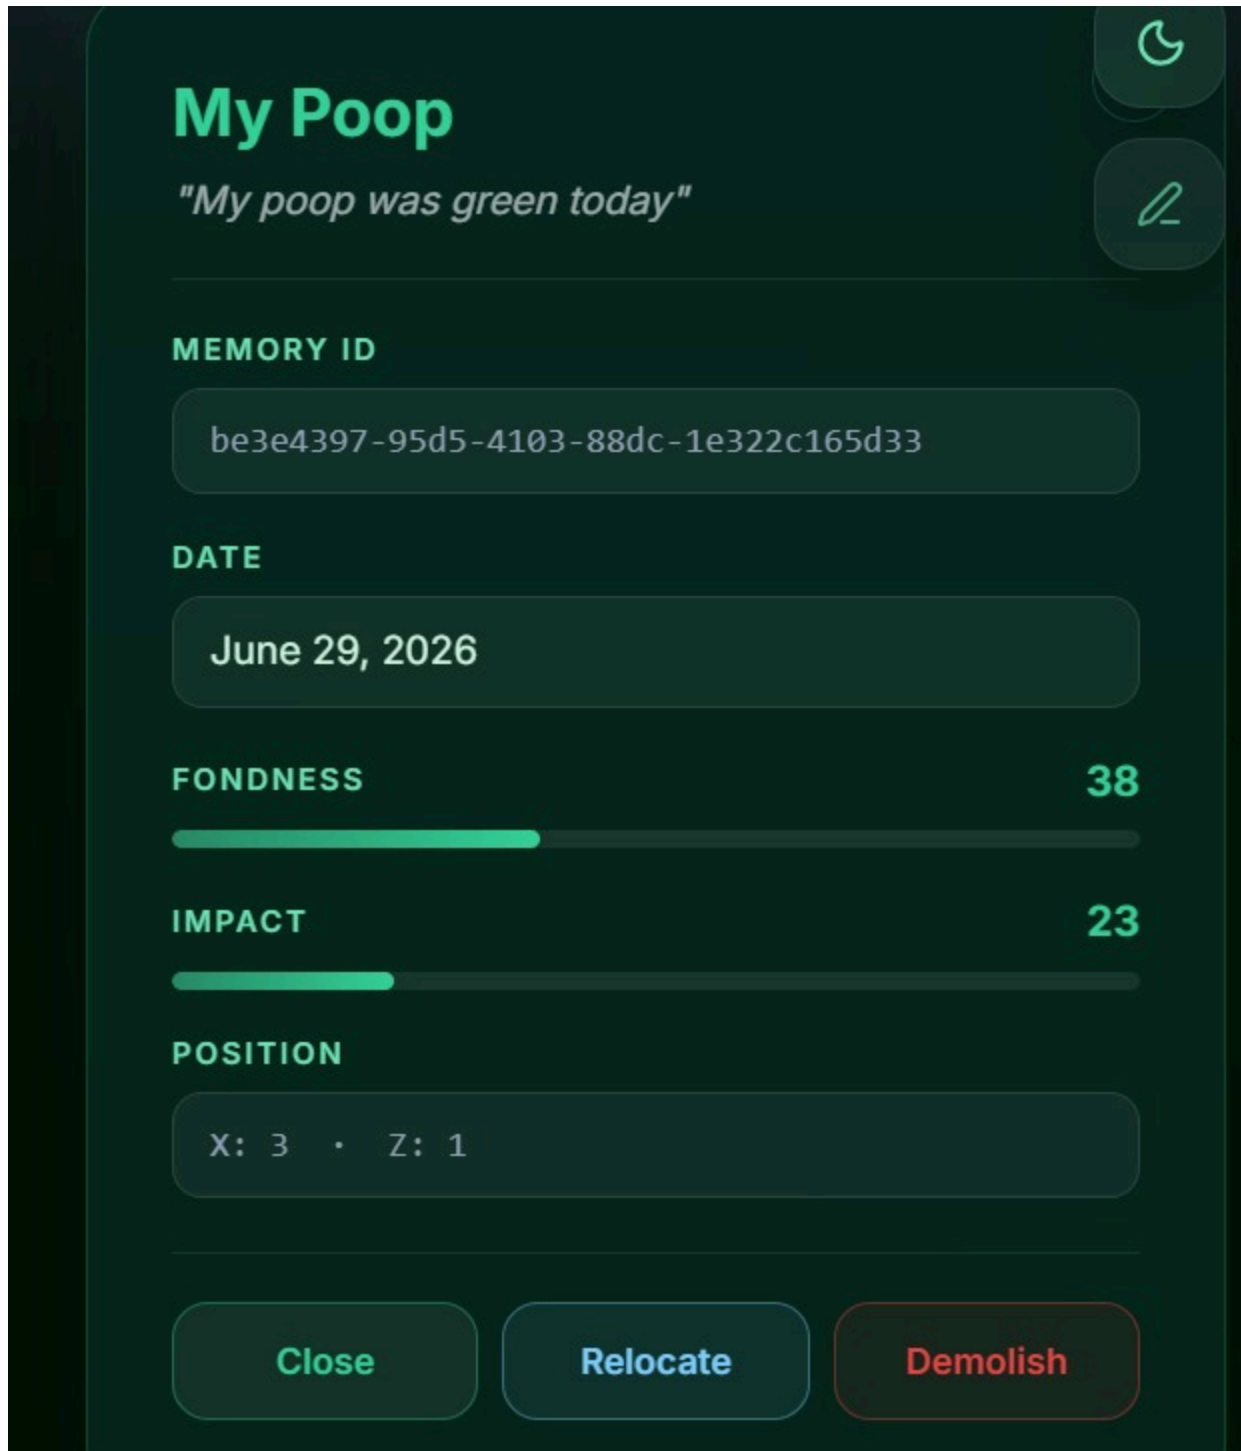

The top layer of the buildings lights are glitching, another possible cool effect is have the building lit up when clicked? Right now it is only set to on hover, this would help it stand out in a city (or you can add like a google maps pin on top of a selected building)

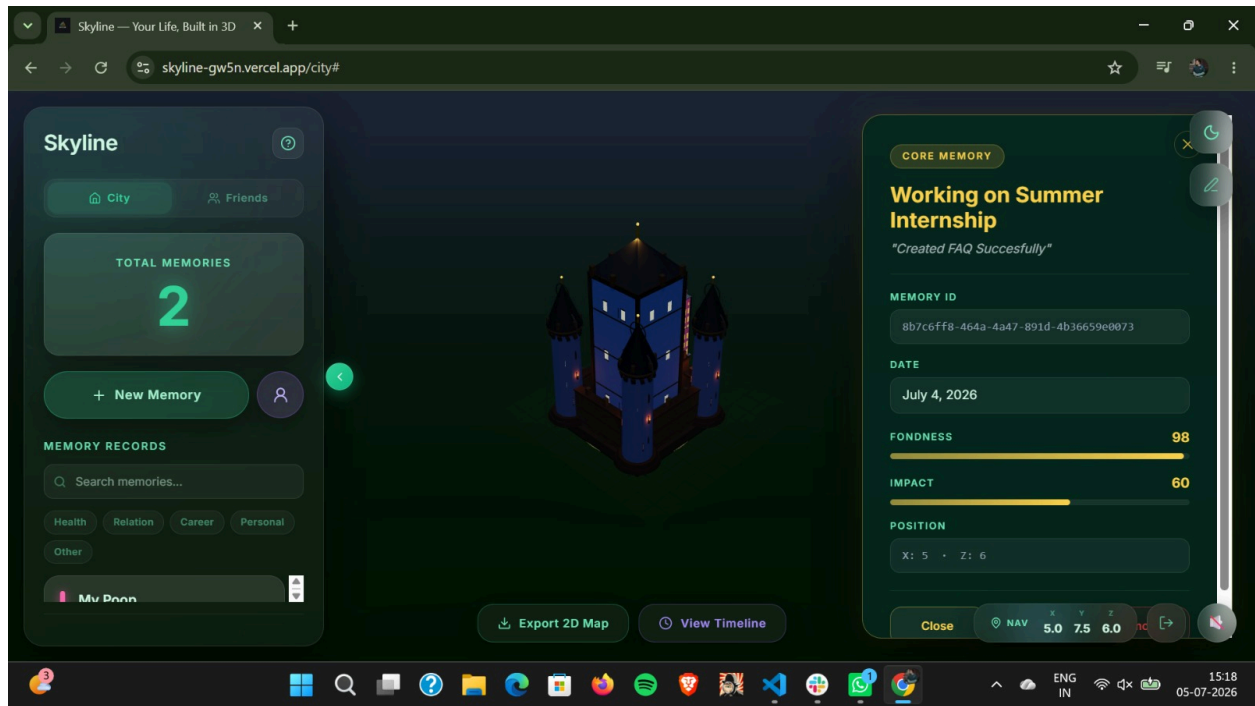

The relocate is kinda unintuitive? Like when someone hovers over a spot it could we have it raise up or glow a bit around the edges?

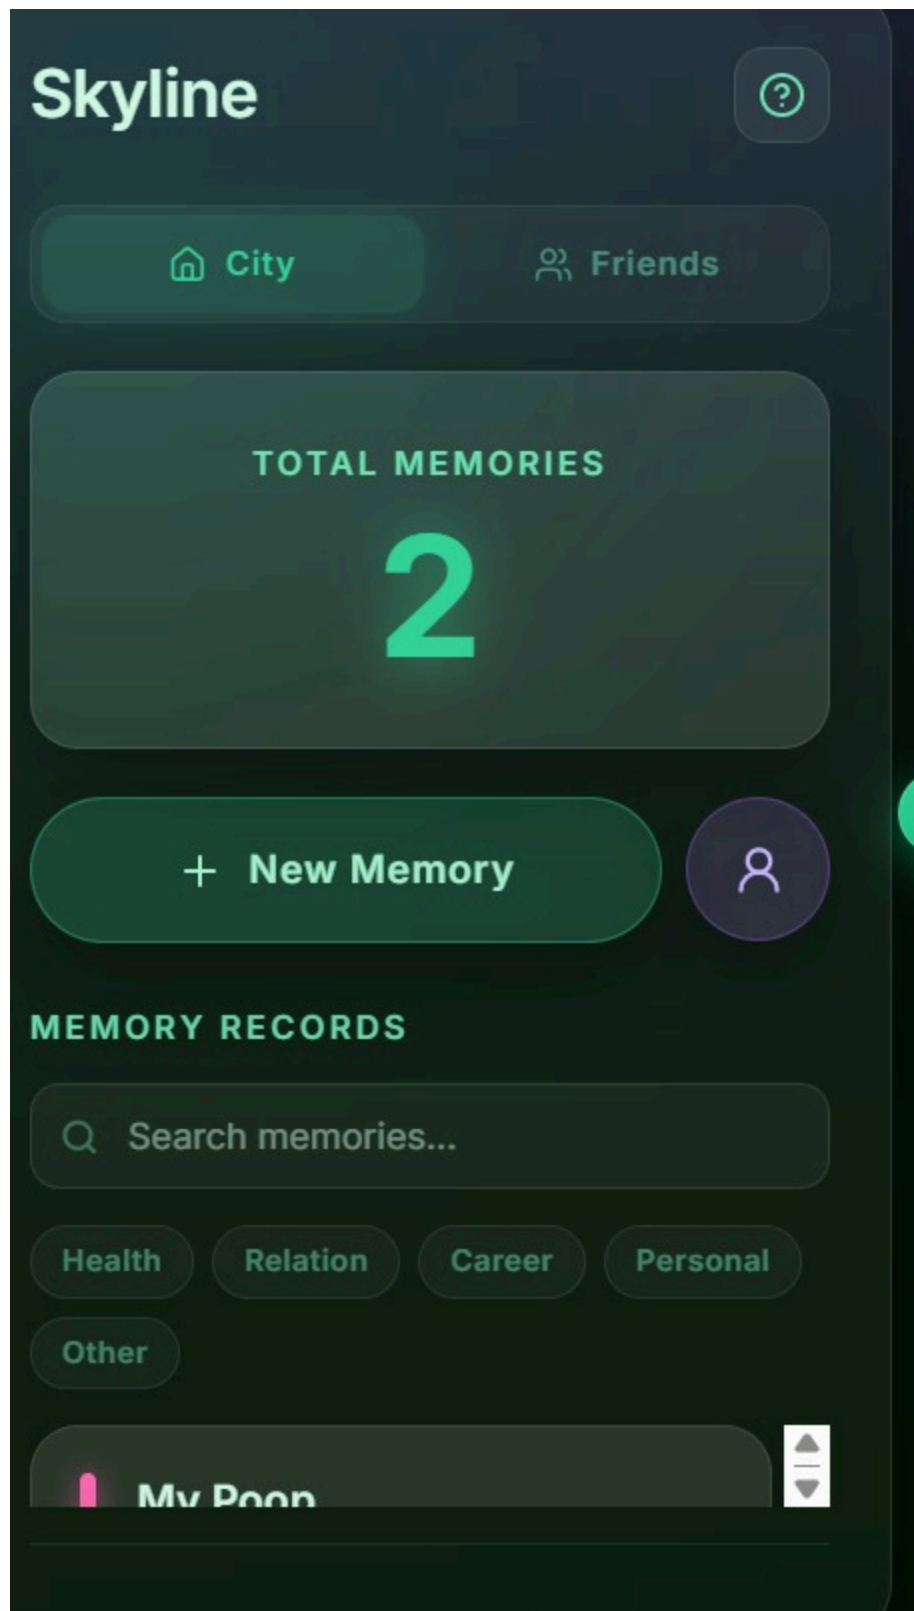

An entirely new update would be having it fill in coordinates and check status on hover, also I cannot edit the caption or something after I create it? I need to demolish and rebuild?

Here I see the top right of the menu is blocked by dark mode and edit colours, I intuitively go to the top right when I want to close stuff but that is blocked, maybe send the icons to the back? (use z-index = -1 in your css), same for all the other widgets like export 2d map, view timeline and coordinates in the bottom

Could we colour core memories to something else?

The menu on the left, I can barely read about my poop and other entries, maybe make the whole thing scrollable as opposed to just the memories?

Also over here the arrow to close the menu is completely off the side of the menu, but when I close it it overlaps with the menu bar (and on the home button)

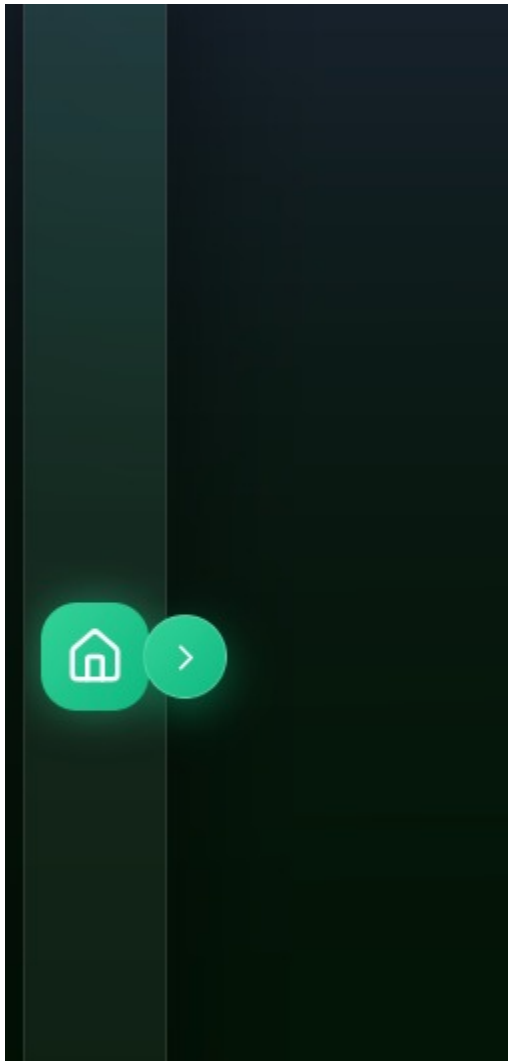

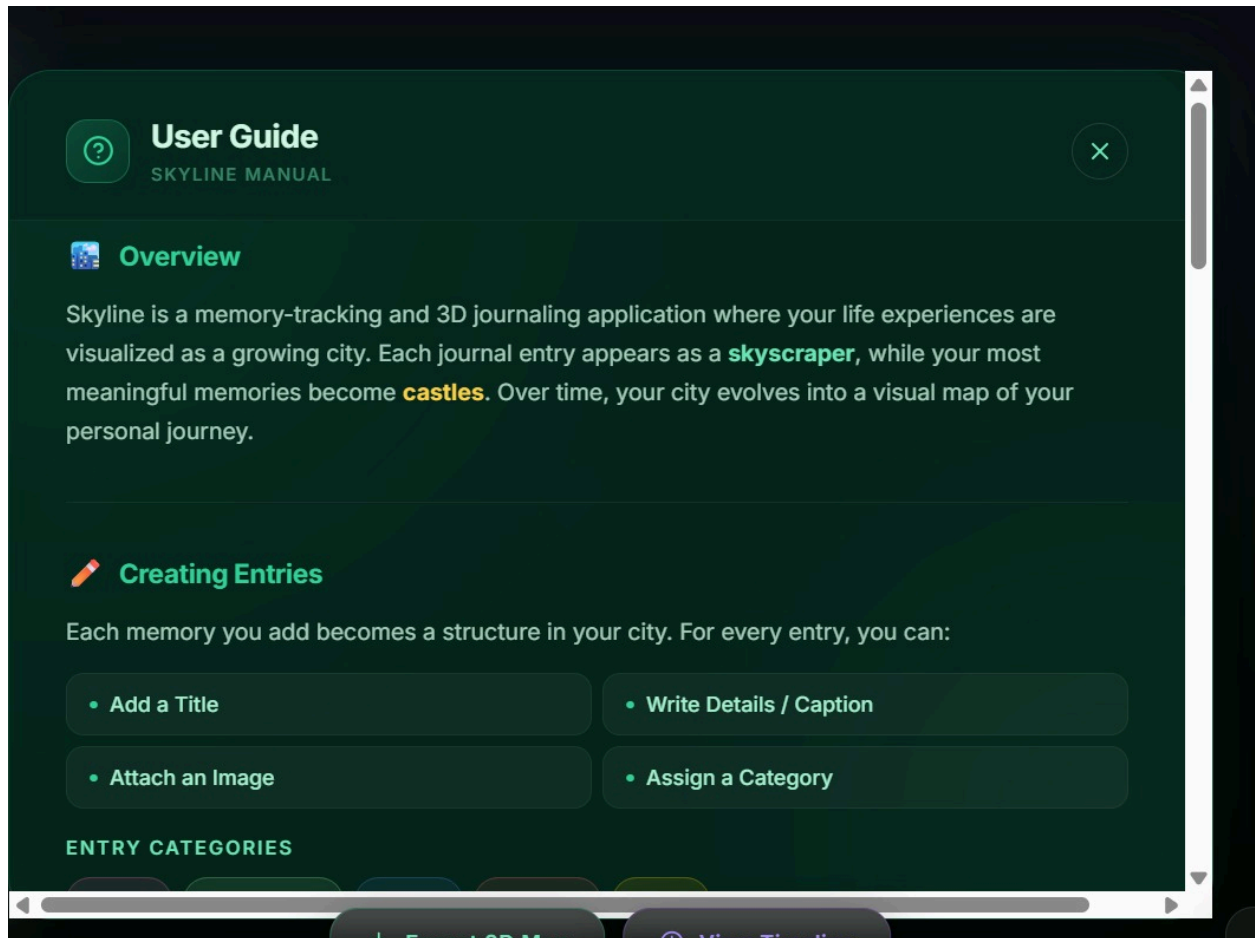

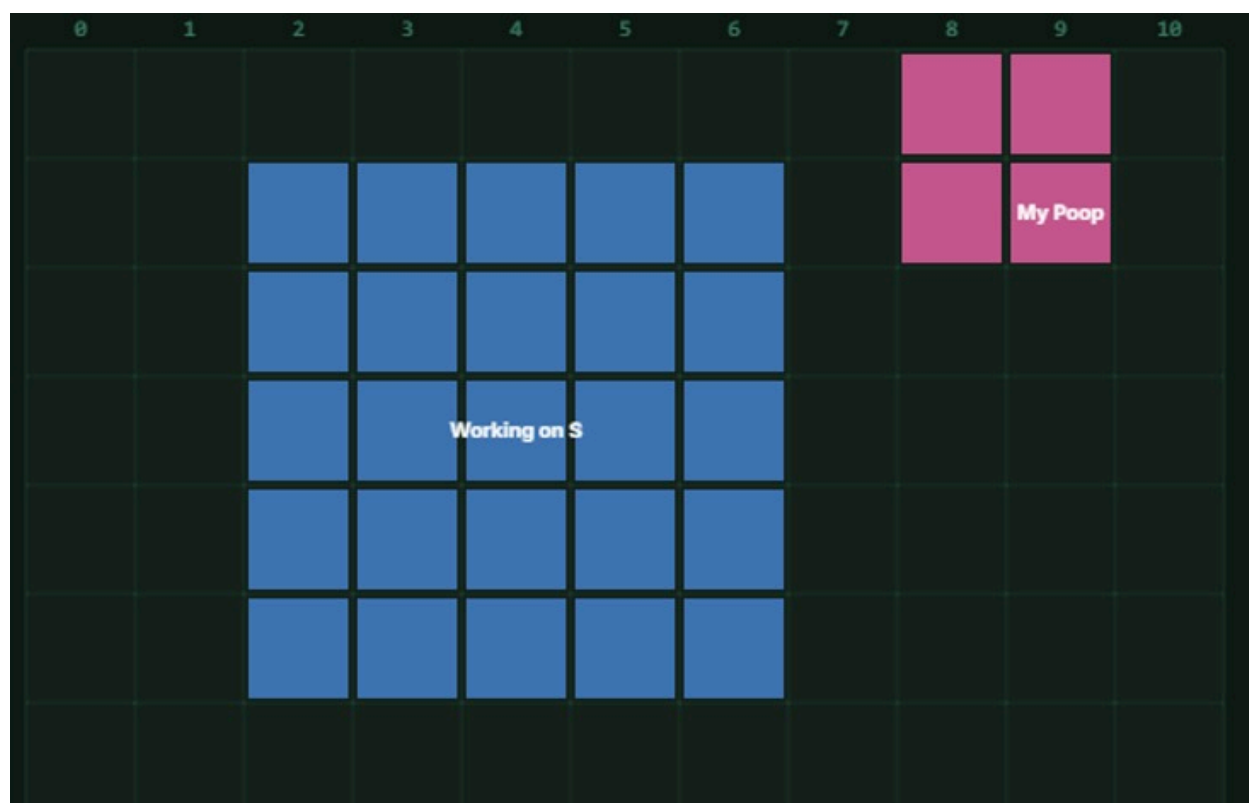

Image for previous point

User guide has a horizontal scroll bar that isn't required also use justify on the paragraph text

Export cuts off titles
